

Lists

1. Create a list called `my_list` with the three following items. Name them `"char_vec"`, `"char_mat"`, and `"lst"`. Draw this list as a train with cargo in the space below.

```
list_el_1 <- "crane"
list_el_2 <- matrix(c("a", "b", "c", "d"))
list_el_3 <- list(c(3.2, 5.7, 9), c(FALSE, TRUE))
```

For each of the following, write the R code to subset the list and then draw the corresponding train or cargo. You're welcome to subset by index, name, or logical; and use `[]`, `[[ ]]`, or `$`, as is appropriate.

2. The same list but without `char_mat`.
3. The character string `"crane"`.
4. The element `"d"`.
5. The element `"d"` repeated several times to form a character vector of length 4.
6. The double vector, as the sole element of a list.
7. The value `TRUE`.
